Design and Story Boarding

What design actually means, and how a storyboard captures a user's experience before a single screen is built.

NEXT →

what is a Design?

Design means solving a problem for a person, on purpose, not by accident. It decides how something looks, works, and feels, before it gets built, and it has to fit inside real limits like time, money, and tech.

User Needs

What slows the user down

Business Goals

What the product must achieve

Feasibility

What's possible to build

what is a Storyboard?

A storyboard is a set of drawn panels, step by step, like a comic strip for an experience. The idea comes from filmmaking, and it shows what the user sees, feels, and does before any screen is designed.

Why it matters?

Shows context before the interface

Storyboard

Frame 1

Maya is waiting in line. Time is ticking. She does not want to lose 10 minutes.

Frame 2

She opens the app and scrolls the menu instead of the physical line.

Frame 3

She taps "Order & Pay" and picks a 5-minute pickup window.

Frame 4

She walks straight to the counter, grabs her order, and makes the meeting.

Frame	User Action	Screen / State Needed
1	Waiting in line, feeling time pressure	No screen yet — this is the reason, not a screen
2	Opens the app, browses drinks	Menu / browse screen
3	Taps "Order & Pay", picks a time	Checkout screen + pickup-time picker
4	Walks in, collects order	Order-ready confirmation (push notification / status screen)

How a storyboard maps to actions and screens

Prototyping

Turning the idea into something people can click through

NEXT →

what is a Prototype and why build one?

A prototype is an early, testable version of the product, made before any real code. Teams build one to explore an idea, test it with users, or get everyone aligned, so problems get caught early instead of after launch.

Explore

Try directions fast

Validate

Test with real users

Align

Get the team on the same page

Reduce Risk

Catch problems early

Three kinds of prototype

Wireframe

Mockup

Interactive

Prototype Example (Mockup)

Task Management

Techniques used in Prototyping

From a stack of paper to a full clickable simulation

NEXT →

TECHNIQUES

Paper Prototyping

Move paper screens by hand
Fastest, no tools needed

Wireframing

Rough layout, no polish
Explores layout fast

Digital Mockups

Polished screens in Figma
Locks the visual design

Interactive/Hi-fi

Linked, clickable screens
Closest to production

Technique	Project Stage	How It's Used
Paper prototyping	Early ideation	Cut-out screens, moved by hand, tested with the team
Sketches / wireframes	Structuring content	Quick layout decisions, before visual polish
Digital mockups	Visual design sign-off	Built in Figma, then approved by the team or client
Interactive prototype	Usability testing & handoff	Tested by real users, then handed to engineers
